Part B: Sharpe after each suggested fix

Nifty 50, research period 2012-2021. Each step keeps the fixes from the steps above it (generated by `compare_fixes.py`). The last row is the corrected script.

step	what changed	Sharpe	accuracy
0	original script (same-day target, 'ret' as a feature, random split, trade at same close)	13.7	1
1	+ remove 'ret' from the features (target is still today's return)	2.85	0.612
2	+ predict tomorrow's direction and score the trade on tomorrow's return (random split still on)	0.55	0.525
3	+ chronological train/test split (no shuffling, 2 days purged)	1.01	0.538
4	+ volume z-score uses only past 60 days, zero volume treated as missing	0.56	0.535
5a	+ execution at next open (still no costs)	0.72	0.53
5b	+ 0.05% per side costs	0.27	0.53
6a	+ walk-forward retraining every quarter, shallow forest (before costs)	0.21	0.514
6b	same, after 0.05% per side costs <- the corrected script	-0	0.514
